**Hole #3**

The Champion Bermudagrass greens are filling in very nicely. The Forest Creek crew has been cutting the greens twice a week.

**Hole #4**

The Forest Creek crew has topdressed the greens and approaches multiple times. Applying sand in this way stimulates the grass to produce new shoots and in turn produces dense healthy turf.

**Hole #6**

A Forest Creek crew member follows behind the person topdressing and drags this broom over the entire area. Dragging and irrigating these areas will efficiently work the sand into any voids in the Champion Bermudagrass and create a nice level surface.

**Hole #11**

The once bare area along the path at the 11th green has been sodded. These type of areas around the course will receive sod or pine straw, which leaves a nice finished look and greatly reduces erosion.

**Hole #3**

The paving crew is working their way around the front nine. Asphalt is necessary in certain areas, but the vast majority of the cart paths have been converted to the screenings material that was tested on hole #4 last year.

**Hole #3**

The fairway bunker on hole #3 is complete. The sod around the edges is growing in nicely and pine straw has been applied to the far left side.

**Hole #4**

As the McDonald and Sons crew finishes their work on a hole, the Forest Creek crew can then start their daily maintenance routine on that hole. This is required in order to keep all turf and bunkers in tip top shape.
