**Hole #18**

The fumigation process is underway! This begins with the spreading of Basamid, which is the only granular soil fumigant on the market that completely sterilizes the soil and eliminates weeds, grasses, nematodes and diseases. Once it is spread and watered the entire surface is covered and sealed with plastic tarps.

The greens will remain under tarps for five days and then require another five to seven days without the tarps before further work can continue to the surface.

**Left greenside bunker #18**

The McDonald & Sons crew have turned their attention to the greenside bunkers. The crew shapes along the painted line to give the exact detail the Fazio design team desires. The greenside bunkers will receive this contouring and new grass, which will restore the natural look and feel they were meant to have.

The finished bunker edge on #18's left greenside bunker.

The short game area has been stripped of all grass. The new green and bunkers will be repositioned and shaped in the coming days.
